

Jesutofunmi Adeboye

SECTION 5

VIRTUAL MACHINE (VM)

Virtual Machine (VM)

A Virtual Machine is a full computer running inside another computer.

It has:

- Its own OS (Linux / Windows)
- Its own CPU, RAM, Disk (virtualized)
- Runs independently from the host system

DevOps Use VMs When:

- You need full OS isolation
- Running different operating systems
- Hosting databases (sometimes)
- Legacy applications

Hypervisor

A hypervisor is a software layer that creates, runs, and manages Virtual Machines (VMs) on a physical computer.

A hypervisor allows you to:

- Split one physical server into many virtual servers
- Allocate resources to each VM
- Isolate VMs from each other
- Run multiple operating systems on one machine

Virtual machines

HANDS-ON PRACTICALS (VERY IMPORTANT)
